MSOS Member Briefing November 2024

Moderated by: E. Robert Feroli, PharmD, FASHP

1

Electronic Communication of Prescription Discontinuation using CancelRx to Improve Medication Safety

Samantha Pitts, M.D., M.P.H.
Assistant Professor, Department of Medicine
Johns Hopkins University School of Medicine

November 22, 2024

2

2

MSOS Member Briefing

November 2024

Gap in Communication of Medication Discontinuation

- Estimated 1.5% to up to 5% medications are dispensed after discontinuation in the EHR.^{1,2}
- Electronic prescribing, or e-prescribing, has been widely adopted.³
 - 1.9 billion e-prescriptions on a major network in 2020³
- Electronic cancellation, or CancelRx, had a slower uptake despite availability of the transaction > 10 years.³
- Fortunately, CancelRx adoption is increasing:³
 - Prescribers: 87%
 - Pharmacies: 90%

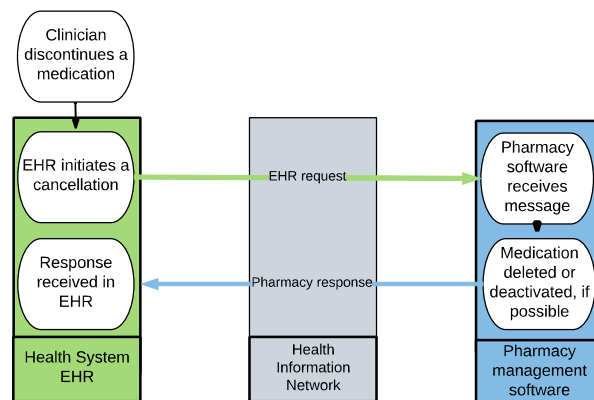

¹Allen AS, Sequist TD. *Ann Intern Med.* 2012 Nov 20;157(10):700–5. ²Copi EJ, Kelley LR, Fisher KK. *J Am Pharm Assoc (2003).* 2018 Jul-Aug;58(4S):S46–S50. ³Data from Surescripts internal analysis; Shervani S, Madden W, Gleason LJ. *JAMA Intern Med.* 2021;181(10):1383–1384

3

CancelRx Transaction

- The prescriber EHR sends a CancelRx message through the health information network to the pharmacy.
- The prescription is deleted or deactivated at the pharmacy, if possible.
- The pharmacy management software sends a response back through the health information network to the EHR.

4

MSOS Member Briefing

November 2024

Evaluation of Electronic Prescription Discontinuation at Johns Hopkins

**Before 2019
Pre-CancelRx**

- Johns Hopkins internal pharmacies used separate pharmacy management software.
- No electronic communication of prescription discontinuation to *internal* or *external* (e.g., chain) pharmacies.

**Jan 2019
CancelRx Implementation**

- Electronic communication of prescription discontinuation using CancelRx to all enabled pharmacies.
- Included *internal* and *external* pharmacies.

**June 2022
Post-CancelRx**

- Johns Hopkins internal pharmacies now use the electronic health record software.
- CancelRx now used for *external* pharmacies only.

End-to-end testing
Proactive risk assessment
Pilot implementation¹

Functional analysis of dose change workflows³

Supported by ¹NCPDP Foundation; ²AHRQ, with pilot by the NCPDP Foundation; ³AHRQ

5

Dispensing After Discontinuation – Interrupted Time Series Results

Proportion of Discontinued Medications Dispensed in 6 Months
Week 52 = CancelRx Implementation

	Pre-CancelRx	Post-CancelRx	p-value
Discontinued e-prescriptions [n]	27171	26127	-
Unique patients [n]	10533	11518	-
CancelRx [n]	0	22443	-
Filled/sold within 6 months [n (%)]	2162 (7.96)	369 (1.41)	<.0001

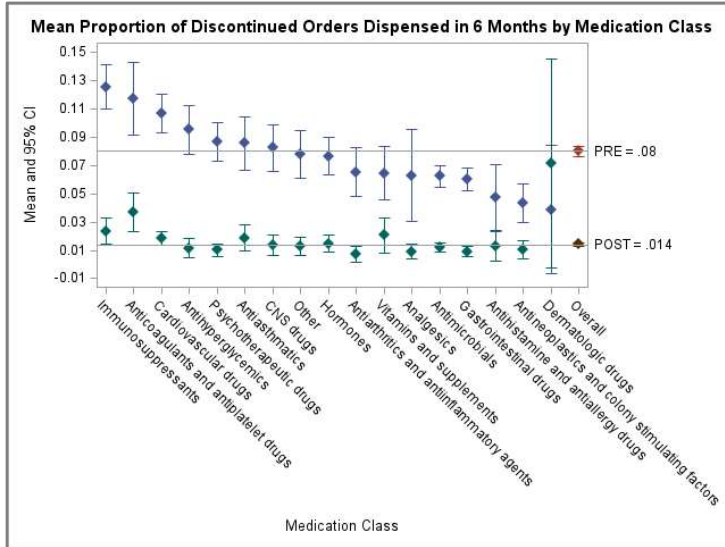

Most remaining dispenses occurred when a CancelRx was not sent due to system settings

6

MSOS Member Briefing

November 2024

Dispensing After Discontinuation by Medication Class

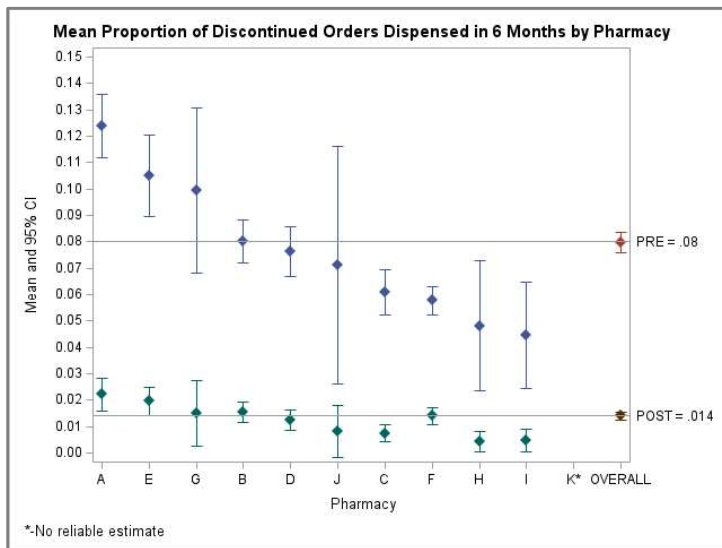

CancelRx implementation reduced variation by medication class

Greatest reductions in classes with high-risk (and chronic) medications

7

Dispensing After Discontinuation by Pharmacy

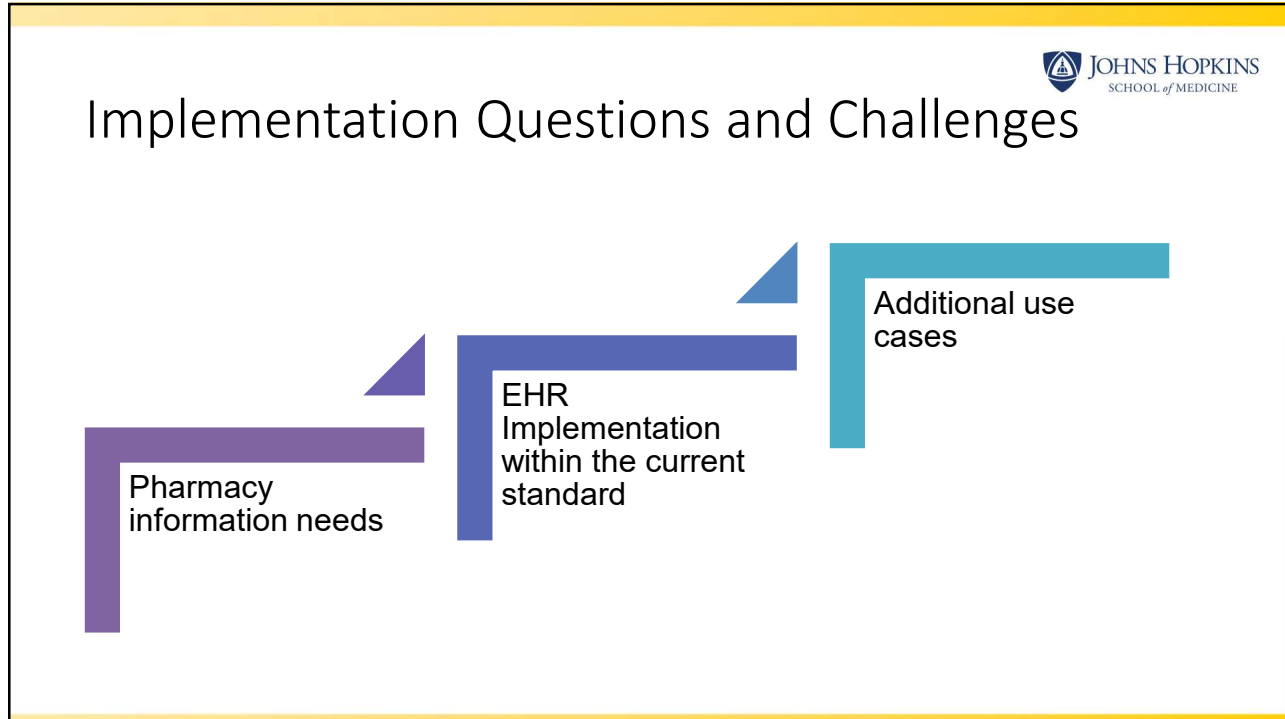

CancelRx implementation also reduced variation by pharmacy

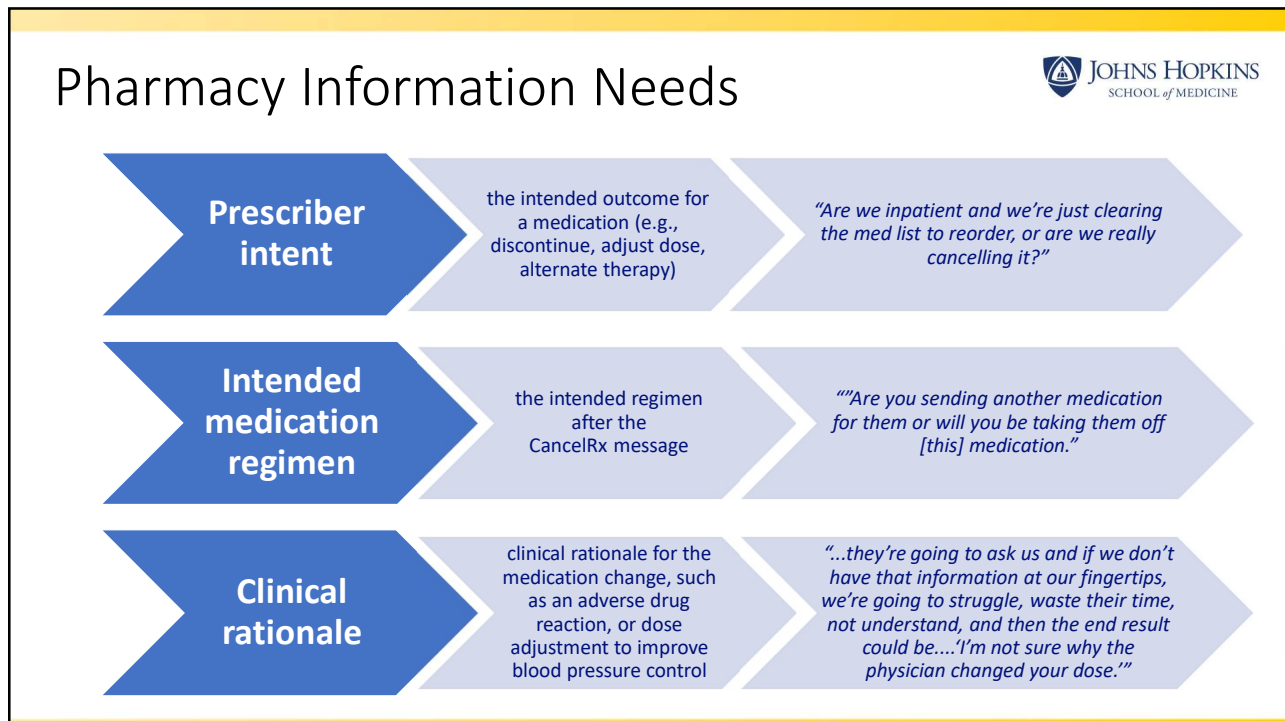

8

EHR Implementation within the current standard

Reordered medications	CancelRx status
<ul style="list-style-type: none">• To send or not send a CancelRx?• Question for health system implementation	<ul style="list-style-type: none">• How does the system show the user the status of a CancelRx?• Question for EHR vendors

11

Additional use cases

12

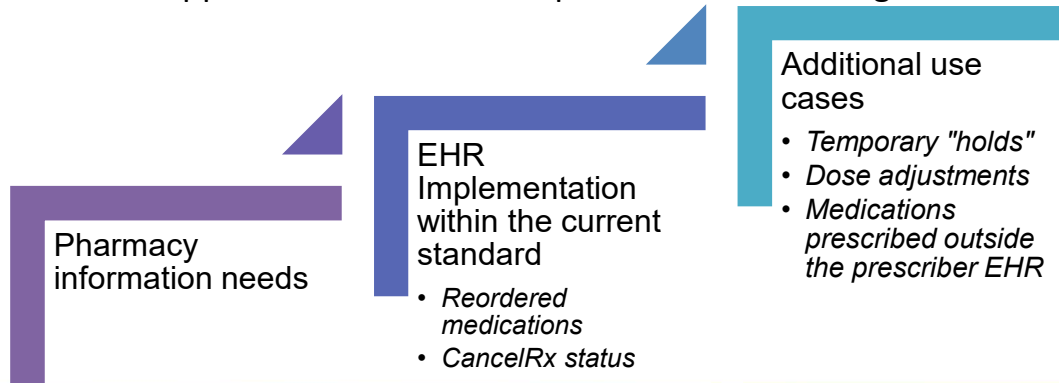

MSOS Member Briefing

November 2024

Conclusions

- Cancel Rx implementation was associated with reduced pharmacy dispensing of medications after discontinuation in the EHR -- an important tool for medication safety
- There are opportunities to address questions and challenges

13

November 2024

Safe Administration of Medications via Enteral Feeding Tube

Erica Fredette, PharmD, BCPS, CPPS – Medication Safety Officer

November 2024

15

Introductions

- Single-hospital community health system located in Weymouth, MA (30 minutes south of Boston)
- 384 licensed beds
- 3rd busiest Emergency Department in the state
- 24 bed Critical Care Unit
- Epic EHR

Erica Fredette
Medication Safety Officer

16

16

MSOS Member Briefing

November 2024

Recognizing the Problem

- In late 2022, our Medication Safety Committee reviewed this ISMP Alert:

Preventing errors when preparing and administering medications via enteral feeding tubes

PROBLEM: Due to the complex nature of preparing and administering medications via enteral feeding tubes, reports of occluded tubes, reduced therapeutic effects, and toxicity leading to patient harm are prevalent. It has been over 12 years since we warned of feeding tube challenges that practitioners and patients often face. Unfortunately, we continue to receive reports related to a variety of issues, including the lack of readily accessible information, gaps in training/experience, unknown feeding tube status, incorrect or inappropriate route or tube size, improper preparation, and wrong administration techniques.

- While we had already converted to 100% ENFit products, the Committee identified multiple other enteral feeding tube practices that needed improvements

17

Specific Gaps Identified

- Medication orders in Epic often have a route of “oral” when in reality the medications are being given via feeding tube
- Nurses often mix multiple crushed medications together and administer them at once (determined through voluntary reports and direct observations)
- There is no Policy / Procedure at SSH for managing enteral feedings or how to safely administer medications via feeding tube

18

18

MSOS Member Briefing

November 2024

Provider-focused Improvements

1. Epic warning (BPA)
2. Review of medications with feeding tube routes
3. Education

19

Ordering Meds Via Correct Route

- Collaborated with Epic analysts to create a new BPA (pop-up warning) in Epic that will trigger when a patient:
 - **Has a feeding tube** documented under LDA activity (lines, drains, airways)
- AND**
- Has any **medication ordered with a route of "oral"**

BestPractice Advisory - Rule, Jax

ⓘ Patient has a feeding tube. Please review route of administration for ORAL medications.

Oral Medications (Active) (From admission, onward)

Start		Dose/Rate	Route	Frequency	Stop
03/04/24 15:15	lisinopril (PRINIVIL_ZESTRIL) tablet 5 mg	5 mg	Oral	Daily	
03/04/24 13:28	acetaminophen (TYLENOL) tablet 650 mg	650 mg	Oral	Every 6 hours PRN	
02/17/22 07:45	cephalexin (KEFLEX) 50 mg/mL suspension 250 mg	250 mg	Oral	Every 6 hours scheduled	

Acknowledge Reason

20

MSOS Member Briefing

November 2024

Allowed Medication Routes in Epic

- Medications with Feeding Tube routes were reviewed and many corrections were made to add or remove routes
 - Quite a few medications may be given via G-tube but not via J-tube
- Provider educational point:** If a feeding tube route is not available in the order composer, this is a good indication that the route is not appropriate – Please check with Pharmacy for guidance.

The image shows two screenshots of the Epic medication order composer for diltiazem. The left screenshot shows the 'Route' dropdown set to 'Oral' with a callout bubble saying 'Restricted to Oral route'. The right screenshot shows the 'Route' dropdown expanded with 'Per G Tube' and 'Per J Tube' options selected, with a callout bubble saying 'Allows feeding tube routes'.

21

Provider Education

Why is this important?

- Not all medications are safe or effective when given via enteral feeding tube**
 - Long-acting dosage forms can be released all at once causing a dangerous spike in levels.
 - Depending on the destination of the tube (J-tube, for example), some medications may not be well absorbed.
 - Some meds can clog the enteral feeding tube.
 - Medications can have unintended physical or chemical reactions when crushed and administered all together rather than separately.

22

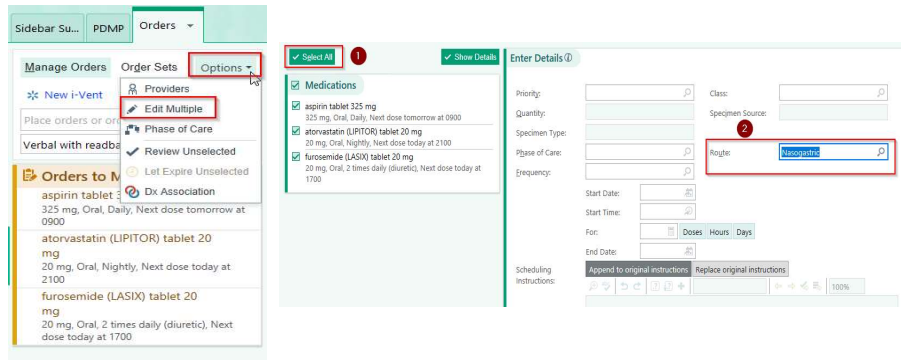

MSOS Member Briefing

November 2024

Provider Education

- Use of the "Edit Multiple" feature in Epic can streamline the process of switching routes.

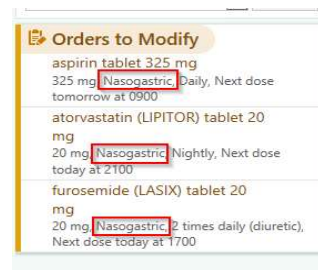

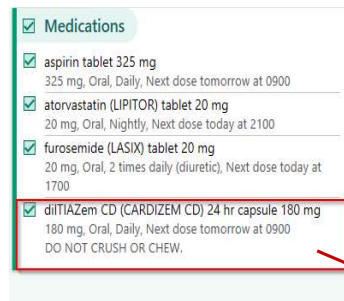

23

Provider Education

If any of the medications selected does not allow the new route, Epic will generate a warning:

24

MSOS Member Briefing

November 2024

Nurse-focused Improvements

1. Policy / Procedure Development
2. Tube Feed holding instructions on MAR
3. Education

25

Standardize Nursing Practice

- Worked closely with the Manager of Clinical Nutrition and nursing educators
- New Procedure document addresses management of patients with Enteral Feeding Tubes
 - Specifies that medications must be given one at a time.
 - Requires feeding tube to be flushed before and after each medication.
 - Includes a section on how to safely unclog feeding tubes
 - References provided for medication-specific details
- Instructions included in Epic MAR regarding when to hold the tube feeds for specific medications

26

MSOS Member Briefing

November 2024

Enteral Feeding Procedure

13. Medication Administration:

- a. Ensure medication order reflects accurate med route
- b. Follow the proceeding steps for general guidance on medication administration for tube feed patients. Refer to appendix for drug specific administration directions.
 - i. Administer each medication separately. Liquid dosage forms should be used when available and if appropriate.
 - ii. Prepare tablets as follows:
 1. Grind tablets to a fine powder and mix with water. (Enteric coated or modified release medications are not to be crushed or administered via feeding tubes.
 2. Open capsules and mix contents with water
 3. Dilute Liquid medications with water
 - iii. Stop the feeding and flush the tube with at least 15mL water prior to administering medication. Flush the tube again with at least 15mL of water and repeat with each medication.
 - iv. Restart the feeding after medication administration at previous rate. Only hold tube feeding for medications as specified in the medication order to avoid altered drug bioavailability.

27

Unclogging Feeding Tubes

- Procedure document establishes a standard process
 1. First line: use Clog Zapper device
 2. Second line: Viokace + sodium bicarbonate tablet
- Available as an order panel in Epic and within feeding tube order sets
 - PRN orders that nurses can access whenever needed without reaching out to the provider

Clogged Feeding Tube	
<input checked="" type="checkbox"/> Clog Zapper (Enteral Feeding Tube Declogging System)	1 each, Feeding Tube, Daily PRN, clogged feeding tube, First line option per Adult Enteral Nutrition Procedure
<input checked="" type="checkbox"/> Viokace and Sodium Bicarbonate pancrelipase (Lip-Prot-Amyl) (VIOKACE) tablet	1 tablet, Feeding Tube, Daily PRN, clogged feeding tube, Second line option per Adult Enteral Nutrition Procedure If ClogZapper is not appropriate for use (Contains: Tree Nuts) follow the following steps: 1.) Thoroughly crush one Sodium Bicarbonate 650 mg tablet 2.) Dissolve the crushed tablet in 15 mL warm tap water (this will take 3-5 minutes, and there may be some precipitate in the water (probably excipients from the tablet)) 3.) Once the Sodium Bicarbonate tablet is dissolved, crush one pancreatic enzyme tablet and mix into the water/bicarbonate solution. 4.) Add the above mixture to 15 mL warm water. Clear the tube of all liquid, then instill the Bicarb-enzyme mixture and clamp for 15-30 minutes. Then flush the tube with 30-50 mL warm water, using a gentle back and forth pressure. 650 mg, Feeding Tube, Daily PRN, clogged feeding tube, Second line option per Adult Enteral Nutrition Procedure
<input checked="" type="checkbox"/> sodium bicarbonate tablet	If ClogZapper is not appropriate for use (Contains: Tree Nuts) follow the following steps: 1.) Thoroughly crush one Sodium Bicarbonate 650 mg tablet 2.) Dissolve the crushed tablet in 15 mL warm tap water (this will take 3-5 minutes, and there may be some precipitate in the water (probably excipients from the tablet)) 3.) Clear the tube of all liquid, then instill the Bicarb-enzyme mixture and clamp for 15-30 minutes. Then flush the tube with 30-50 mL warm water, using a gentle back and forth pressure.

28

MSOS Member Briefing

November 2024

Holding Tube Feeds

- Administration Instructions in Epic have been updated for products that should be separated from tube feeds
- We adopted the ASPEN recommendation to hold for 30 minutes before and after med administration – **this differs from some previous recommendations to hold TF for several hours**
 - The goal is to allow for safe medication administration without depriving patients of too much nutrition

levoFLOxacin (LEVAQUIN) tablet 750 mg[Ⓜ] Dose: 750 mg : Per G Tube : Daily :

Admin Instructions:
Hold tube feedings at least 30 minutes before and 30 minutes after administration

Recommendations

Gastric	<ul style="list-style-type: none"> Dilute oral solution with water (at least 1:1) prior to administration. Consider holding EN for 1 hour before and 2 hours after each drug dose.
Postpyloric	<ul style="list-style-type: none"> As above. Monitor for any unexpected change in effect.
Other	<ul style="list-style-type: none"> As with all antimicrobials, consider parenteral alternative for acutely ill patients to ensure therapeutic concentrations.

33

Pharmacist Education: Types of Feeding Tubes

Feeding tubes are primarily categorized by where they **end** in the GI tract and where they **begin**:

- Gastric / gastrostomy tubes (G tubes) end in the stomach**
 - Gastric – inserted through the mouth or nose down esophagus
 - Gastrostomy – through the abdominal wall, usually more permanent
- Jejunal / Jejunostomy tubes (J tubes) end in the jejunum**
 - Jejunal – inserted through the mouth or nose down esophagus
 - Jejunostomy – through the abdominal wall, usually more permanent
- Duodenal tubes (used less commonly) end in the duodenum**

34

MSOS Member Briefing

November 2024

Pharmacist Education: Types of Feeding Tubes

Various Types of Gastric / Gastrostomy Tubes

NG tube	<i>Nasogastric Tube: inserted through the nares and passes through the posterior pharynx, through the esophagus and into the stomach</i>
Dobhoff (NG) tube	<i>Small diameter NG tube with a weight on the end. The weight helps with tube placement and may provide an additional barrier to potential aspiration risk. Dobhoff tubes tend to be more comfortable for the patient.</i>
OG Tube	<i>Orogastric Tube: similar to NG except it begins in the mouth instead of the nasal passages</i>
G Tube / PEG Tube	<i>Gastrostomy Tube: feeding tube that passes through the abdominal wall and is inserted directly into the stomach PEG tube: percutaneous endoscopic gastrostomy tube – placed using endoscopy to be able to guide the tube into the correct place in the stomach, most commonly used in patients who require more permanent enteral feeding</i>
G-J Tube	<i>Gastrojejunostomy Tube: enters the stomach in the upper part of the abdomen and is threaded into the small intestine. This one has three ports, the gastric port sits in the stomach and is used for medications, the jejunal port sits in the jejunum and is used for feeding</i>

Picture of a G-J Tube

35

Learning Points for Pharmacists

- Oral liquids are not always appropriate for feeding tubes
 - Some of these are too viscous for this administration route
- Opening capsules may or may not be acceptable, depending on the powder or beads inside
 - Enteric coated beads often do not dissolve well for administration
- Please do not instruct nurses to extract liquid from closed capsules using a needle (docusate, calcitriol)
 - Use of a parenteral syringe to prepare ENTERAL medications has resulted in serious medication errors
 - ISMP (Institute for Safe Medication Practices) has repeatedly warned against this unsafe practice

36

MSOS Member Briefing

November 2024

Check and Adjust

37

Ongoing Improvements

- Providers are dismissing the BPA most of the time and not updating ordered routes.
- *Proposal 1:* Change triggering action from Sign Order to Document Note. Providers are likely to be more receptive to advice when they are not in the midst of placing medication orders.
- *Proposal 2:* Develop a BPA that sends an in-basket message to pharmacy for any mismatch of documented feeding tube (on the LDA) and ordered medication route.

Bi-Annual Report on Vaccination Errors

<https://home.ecri.org/blogs/ismp-resources/vaccine-bi-annual-report>

- Analysis of 1,987 event reports submitted to the ISMP VERP in 2022 & 2023 shows that most of the reported errors reached the patient
- Most of the reports were submitted by a practitioner working in the outpatient setting and most frequently included the wrong vaccine and expired vaccine
- As vaccination programs seek to achieve high immunization coverage, more needs to be done to reduce the risk of vaccination errors since they can lead to inadequate immunity, increased cost, and reduced confidence in the healthcare delivery system
- Comprehensive risk-reduction strategies included in the report
